

MOHAN BABU DODDAPANENI

Full Stack Developer | Java & Spring Boot | Angular & React | AWS | AI-Assisted Development
MA, USA | 978-208-4167 | mohanbabud25@gmail.com | linkedin.com/in/mohan-babu-doddapaneni

PROFESSIONAL SUMMARY

Full Stack Developer with 6+ years shipping production systems on Java (8 to 21), Spring Boot microservices, Angular, and React. Currently own the admin and data-access layer of a multi-tenant SaaS commerce platform serving 40+ enterprise retailers at 2.5M+ orders per month, from data model through REST and GraphQL APIs to the front end on top. Strongest at the work that keeps a platform trustworthy at scale: pagination and caching contracts that hold at tens of millions of records, tenant isolation enforced in one place, and the quiet data bugs dashboards never surface. Use AI coding tools daily (Claude Code, GitHub Copilot, Cursor) alongside code review, SonarQube gates, and JUnit coverage, so speed does not cost quality. M.S. in Computer Science, Clark University. Expertise in Data Structures & Algorithms, applying optimized techniques to build scalable, high-performance systems capable of handling millions of requests with minimal latency.

TECHNICAL SKILLS

Languages	Java (8 / 17 / 21), TypeScript, JavaScript (ES6), Python, SQL, HTML5, CSS3
Backend	Spring Boot, Spring MVC, Spring Data JPA, Hibernate, Microservices, REST APIs, GraphQL, Node.js, Express.js, Swagger / OpenAPI, Query Optimization
Frontend	Angular, RxJS, React, Redux, Next.js, Bootstrap, Tailwind CSS, Material UI, Responsive Design, Server-Side Pagination, Lazy Loading, Virtual Scrolling
Data & Messaging	PostgreSQL, MySQL, MongoDB, DynamoDB, Redis, Elasticsearch, OpenSearch, Apache Kafka, RabbitMQ
Cloud & DevOps	AWS (ECS, EC2, S3, Lambda, API Gateway, Athena, CloudWatch), Azure, Docker, Kubernetes, Jenkins, GitHub Actions, Terraform, Maven, Git, CI/CD
Security	Spring Security, OAuth2, JWT, Role-Based Access Control, Multi-Tenant Isolation, OWASP Top 10, CVE Remediation
Testing & Quality	JUnit, Mockito, Jest, Cypress, Postman, SonarQube, Code Review, Agile / Scrum, Jira
AI Tools	Claude Code, GitHub Copilot, Cursor, OpenAI Codex, ChatGPT, Prompt Engineering, AI-Assisted Code Review and Test Generation
Architecture	Multi-Tenant SaaS, Microservices, Event-Driven Processing, API-First Design, Caching and Idempotency Patterns, Performance Tuning

PROFESSIONAL EXPERIENCE

Fenix Commerce

Worcester, MA

Multi-tenant SaaS commerce platform on Java, Spring Boot microservices, Angular, Elasticsearch, Kafka, and AWS, serving 40+ enterprise and mid-market retailers across 12 product modules at 2.5M+ orders per month at peak.

Product Development Engineer

January 2026 - Present

- Own the multi-tenant Business Console, the surface every retailer and internal team works in across 12 platform modules. Rebuilt a six-year-old Angular app into a modular component architecture with a shared design system and lazy-loaded feature modules, and the team now ships console features weekly rather than quarterly.
- Fixed large-tenant screens that were unusable because the console pulled full tables into the browser. Defined a server-side pagination and filtering contract across Spring Boot and Elasticsearch, paired with virtual scrolling and lazy loading. Views over tens of millions of order, fulfillment, and inventory records now open in seconds inside a fixed memory budget.
- Traced wrong inventory numbers to an unset Elasticsearch trackTotalHits ceiling that silently capped catalog aggregations at the engine default, leaving every large-catalog tenant reading a fraction of its real data. Rebuilt the query path on heap-safe cursor traversal that streams full result sets in constant memory, restoring accurate reporting across catalogs above 6M products.
- Root-caused a real-time ingestion outage during a 1.4M-event holiday surge: a JVM fast-throw optimization was stripping stack traces from an unguarded parsing exception, hiding the real failure while retries piled up behind a six-second third-party timeout. Hardened the parser, added failure logging, and brought event flow back under peak load.
- Closed a data-exposure gap where a third-party API limitation pushed internal data into merchant panels and customer emails. Built a server-side cache keyed on SHA-256 composite hashes with sub-20ms lookups, walling internal data off from tenant-facing surfaces with no measurable added latency.
- Modeled the permission and access-provisioning scheme governing what each retailer, role, and internal team can see and change, enforced centrally in Spring Security, and turned dozens of settings that used to need a backend release into a self-serve admin layer.
- Use Claude Code, GitHub Copilot, and Cursor daily across the delivery workflow: scaffolding Spring Boot services and JUnit suites, migrating legacy Angular components, drafting first-pass API contracts, and reading unfamiliar stack traces. Refactors that used to take days now land the same day, and every AI-assisted change still clears human review, SonarQube gates, and tests before merge. Wrote the prompt and review patterns the team now follows.
- Built the experimentation platform into the console with MurmurHash3 bucketing, zip-code targeting, and configurable goals, so retailers run tests without pulling in engineering. Moved product and inventory sync off REST polling to the GraphQL Admin API with bulk queries, and ship Dockerized Spring Boot services to AWS ECS through PR-gated Jenkins pipelines with SonarQube gates.

Adobe Inc.

MA, USA

Cloud-native asset management and real-time collaboration platform inside Adobe Creative Cloud, built on Java, Spring Boot, React, Next.js, Kafka, PostgreSQL, and AWS.

Full Stack Developer

September 2024 - January 2026

- Led the design of a cloud-native asset management and collaboration platform for Creative Cloud, covering horizontal scaling, high availability, and integration with third-party tools and Adobe Sensei AI services.
- Broke a monolithic delivery path into Java and Spring Boot microservices so teams could build and deploy independently, which supported 50% faster feature delivery across product suites including Photoshop and Illustrator.
- Connected creative peripherals such as styluses and tablets through secure APIs and an event-driven pipeline capturing input in real time, making concurrent editing and asset versioning reliable for distributed teams.
- Shipped adaptive interfaces in React (Redux, Hooks), Next.js, and Tailwind CSS. Engagement rose 10% and interface errors dropped 30% against Adobe Analytics telemetry, helped by tighter Redux state handling that cut validation errors 25%.
- Built real-time alerting for asset status changes, collaborative edits, and version conflicts on WebSockets and Kafka, so users stopped losing work to silent overwrites.
- Shipped AI-driven layout suggestions built from user history and asset metadata, speeding up design creation for new users by 30%.
- Cut query response times 18% by partitioning and indexing the PostgreSQL tables behind large asset searches, and secured assets and session data end to end with TLS/SSL and OAuth 2.0.

Capgemini Technology Services

Hyderabad, India

Enterprise Java, Spring Boot, and React applications for financial services and product-engineering clients.

Associate Consultant, Full Stack Developer

September 2020 - July 2023

- Built the microservices behind a financial application covering account management, transactions, customer profiles, and fraud detection, with the isolation and access controls sensitive data requires.
- Rebuilt the backend on modular Spring Boot services with Hibernate ORM over PostgreSQL and MySQL, cutting API latency 50% and feature development time 40%.
- Cut reported security vulnerabilities 90% across the client portfolio by hardening Spring Security configurations: role-based authorization, token-based authentication, method-level access control, CSRF protection, and secure session management.
- Migrated 18 Java projects to Maven in under 30 days and remediated vulnerable log4j dependencies across the portfolio, bringing every project back into CVE compliance ahead of the client deadline.
- Delivered client dashboards in React over Node.js REST services covering task and project creation, user management, timelines, and real-time task visualization.
- Replaced always-on batch jobs with AWS Lambda for event-driven processing and deployed services on EC2 behind Auto Scaling and load balancing, lifting uptime 20%.
- Cut post-deployment defects 30% by adding JUnit coverage and profiling the slow paths testing kept missing, and stood up a Swagger API portal with interactive docs, sample calls, and auth details for every endpoint.

Wipro

India

KYC and AML compliance platform for a banking client on Angular, Spring Boot, Thymeleaf, and PostgreSQL.

Junior Full Stack Developer

July 2019 - August 2020

- Built KYC onboarding modules in Angular with Reactive Forms and dynamic validation rules, which supported accurate registration of 5,000+ customer profiles.
- Restructured JSON responses from Spring Boot backend services so analysts saw the fields they actually needed, cutting AML alert review time 30%.
- Configured Spring Security login, logout, and role-based access control across four KYC modules for compliance, and designed Thymeleaf and Bootstrap review screens that made flagging suspicious activity 25% faster.
- Wrote the PostgreSQL queries behind analyst comments, risk scores, and audit trails across 10,000+ transaction records.

PROJECTS

Career Path Recommendation System

Python, Django, NLP, PostgreSQL

Recommendation engine that parses resumes with NLP, predicts career paths, names the skill gaps in the way, and serves results over REST APIs.

Restaurant Ordering Portal

Java, Angular, MySQL

Ordering portal with a normalized schema for menus, modifiers, and orders, and transactional placement so a dropped or duplicate request never leaves a partial order. Processed 300+ orders.

EDUCATION

Master of Science in Computer Science, Clark University, Worcester, MA

B.Tech in Electronics and Communication Engineering, JNTUA, India

CERTIFICATIONS

AWS Cloud Essentials | Azure Fundamentals (AZ-900) | Java Cloud Native Developer L1 & L2 | Python Automation Practitioner
